

MTBF Prediction Report

PRODUCT NAME : LS-571TXD

The following report follows the Bellcore Technical Reference;
TR-332(Issue 6 ,December 1997)" Reliability Predication Procedure for
Electronic Equipment "Document. Which describes what are termed
permanent or hard component failure and intermittent compononent
failures confirmed or conformable by failure analysis,that is,the date
gathered for TR-332 omly counts confirmend physical failures.
The failure rates described are only for confirmed or conformable
failure mechanisms such as dielectric breakdown ,
dlectromigration,ionic contamination
corrosion, ---etc.The predictions are based solely on the Method I ,
PartsCount Procedure.

MODEL: LS-571TXD

Component	FITs	Q'ty	Duty Cycle @Power On (Percent)	FITs with Duty Cycle	Note	Data From
CPU Board	7952	1	100	125752	*1	
TOTAL FITs				7952		
MTBF(Hours).Ground ,Fixed,Controlled)GB),50 degree Celsius.				125752		

NOTE:

1. The FIT Values of all parts of Mainboard are on the next two pages.
2. FIT: Failure in Time; A "Steady_State" failure rate.
"Steady-State" is that phase of the product's Operating Life during
which the failure rate is constant.Herein the steady-state
phase is assumed preceded by an infant mortality phase
characterized by a decreasing Failure Rate.
3. Troubles caused bu transient faults ,software problms,procedural
errors .or unexpected operating environments can have a significant
impact on System Level Reliability.therefore Thos Report could only be
used to Predict System Hardware Failures.

4. The System is modeled as a "serial system " of all components.
 i.e the failure of any component will cause a failure of the system.
5. All the dailure rates in this report are expressed as failure per
 10^9 operating hours
 denoted as FITs.
6. MTBF= 10^9 /FITs(hours)
